4.30 - Ajax, configuration pages, improved proof workflow

04 May 2023

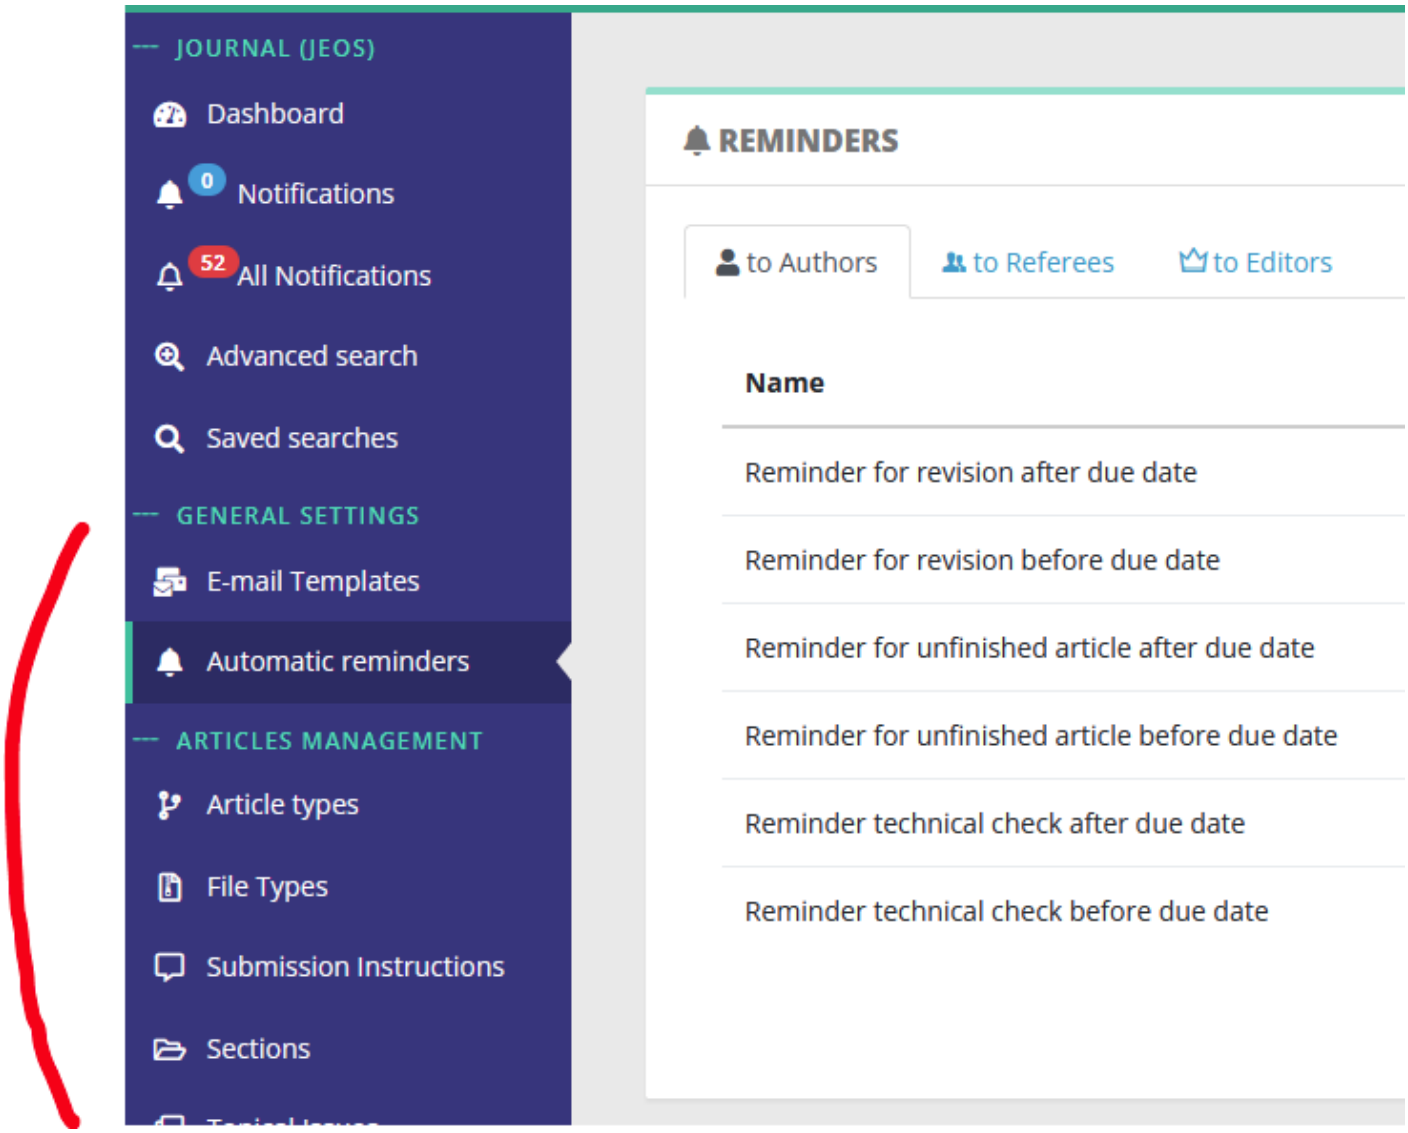

Ajax everywhere

Thanks to Ajax, Nestor quits refreshing whole pages each time you edit an article!
Now, Nestor refreshes only necessary parts, in the background. On the whole, response times and user experience feels much faster.

Editor interface: small improvements in configuration pages

With an editorial office account, you probably noticed that the left menu is getting more crowded with each version.

- We have reordered the different options, to (hopefully) make more sense. In the near future, the left menu will probably undergo another makeover to save space / be clearer. Your suggestions are welcome.

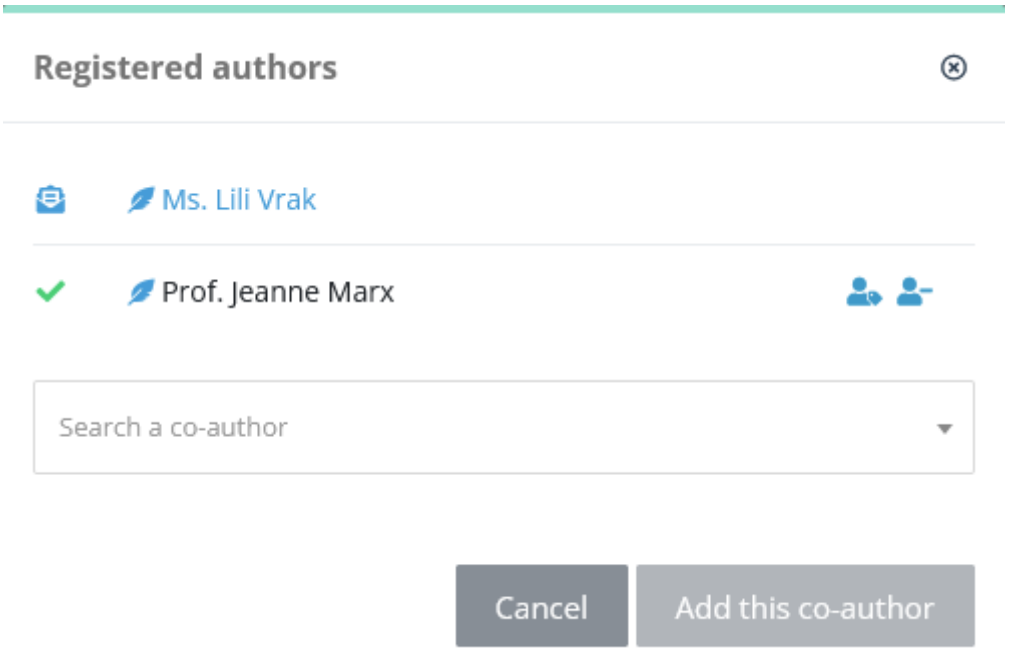

- Configuration pages have been renamed properly:
  - Object lists
  - Creation pages (New object)
  - Edition pages now display the object name (Edit object - Name)

Editor interface: adding co-authors is now easier

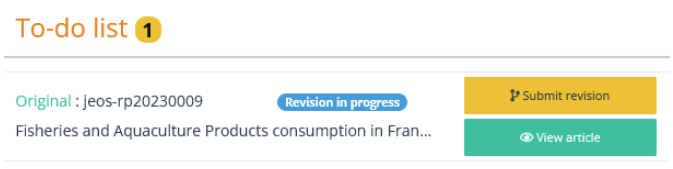

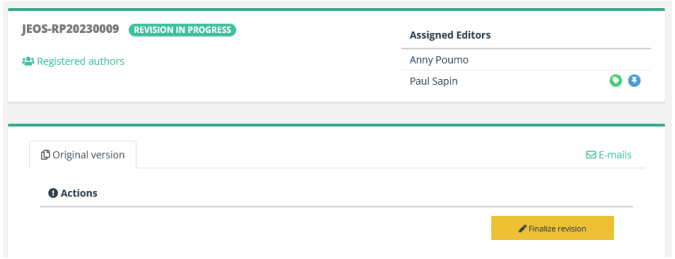

The co-author search tool described in version 4.10 has been extended to the co-author module in the back office. It is now easier to find co-authors and add them to an article.

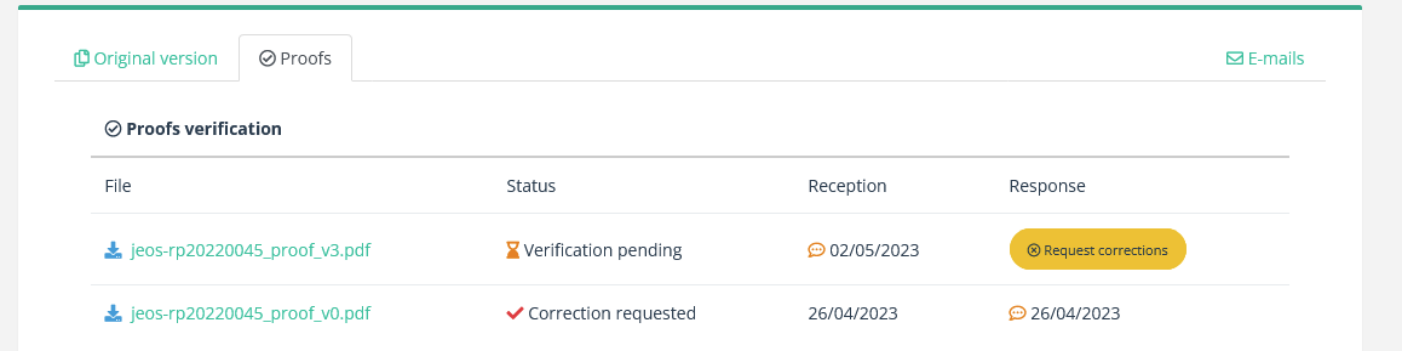

Author interface: Improved proof correction workflow

The author interface benefits from two updates:

- For a given article, critical actions are now visible both on the dashboard and the article.

Dashboard page	Article page
	

- The proof correction interface has been revamped and lightened
