5.00 - Saved searches display, revert actions, mail enclosures

7 November 2023

Customised display on search results

The improvements on article lists (which rolled out in 4.70) have been extended to saved searches. That means:

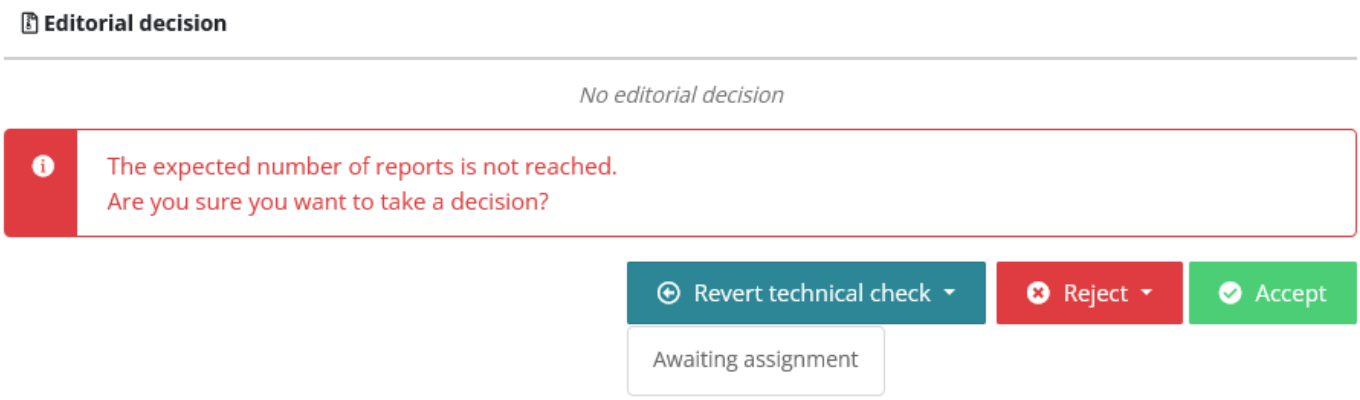

- displayed columns
- columns order
- preferred sorting criteria
- number of results displayed

are now saved independently for each saved search. For example if you search for a specific special issue, you can mask the column 'special issue' in the results, while keeping it in your regular dashboards.

Improvement on revert actions

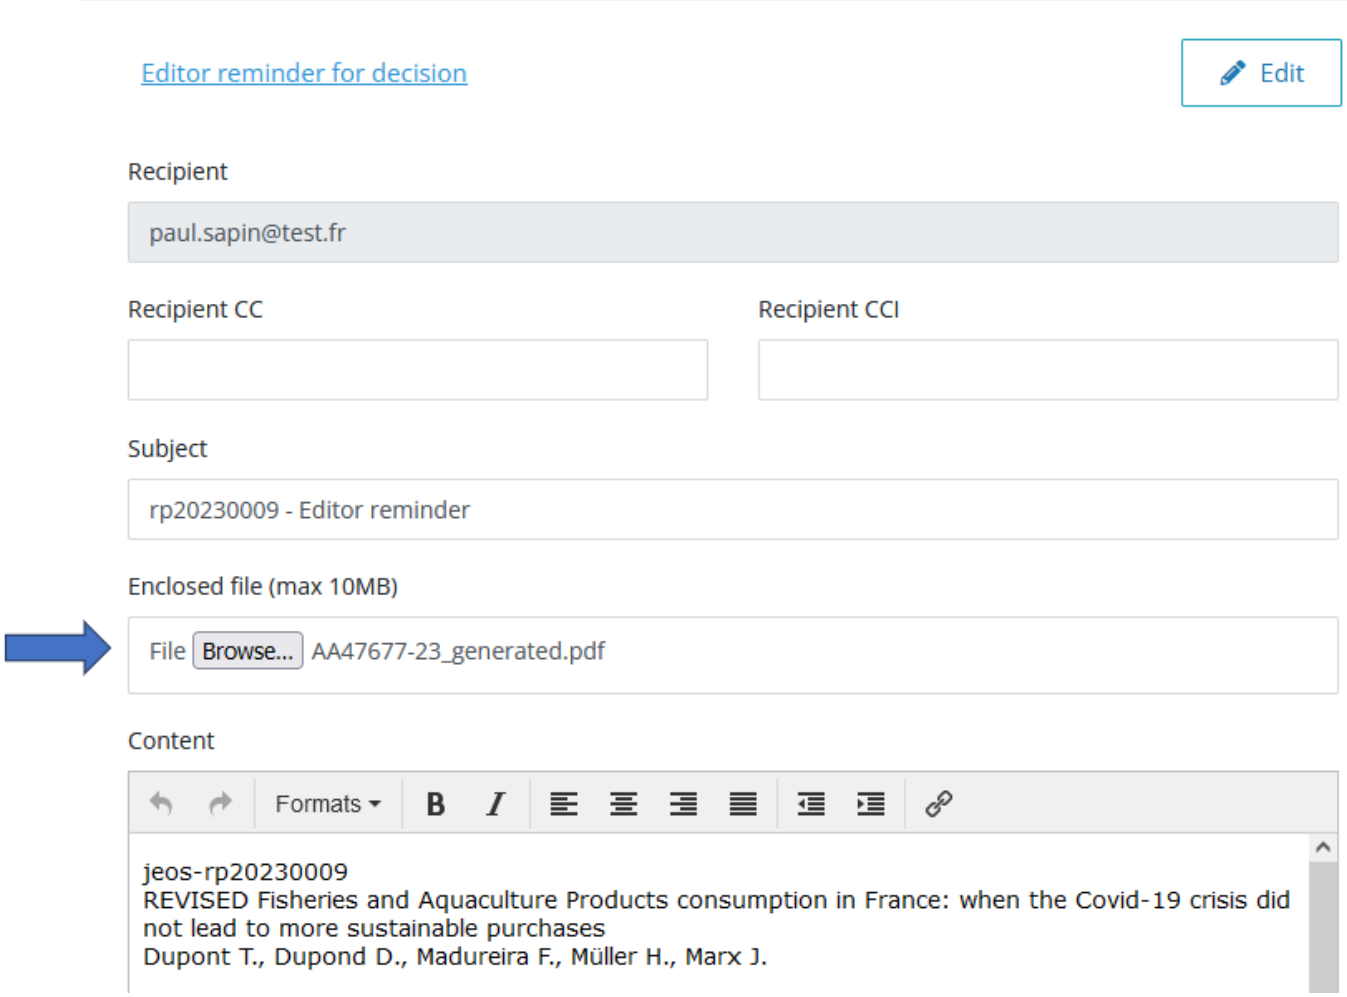

The scope of revert actions has been extended to all non-critical statuses. This allows easier management/corrections of article workflows, specifically for technical checks and such.

Furthermore, revert actions are labelled more explicitely, and the status of arrival is displayed when clicking on revert buttons.

Mail enclosures

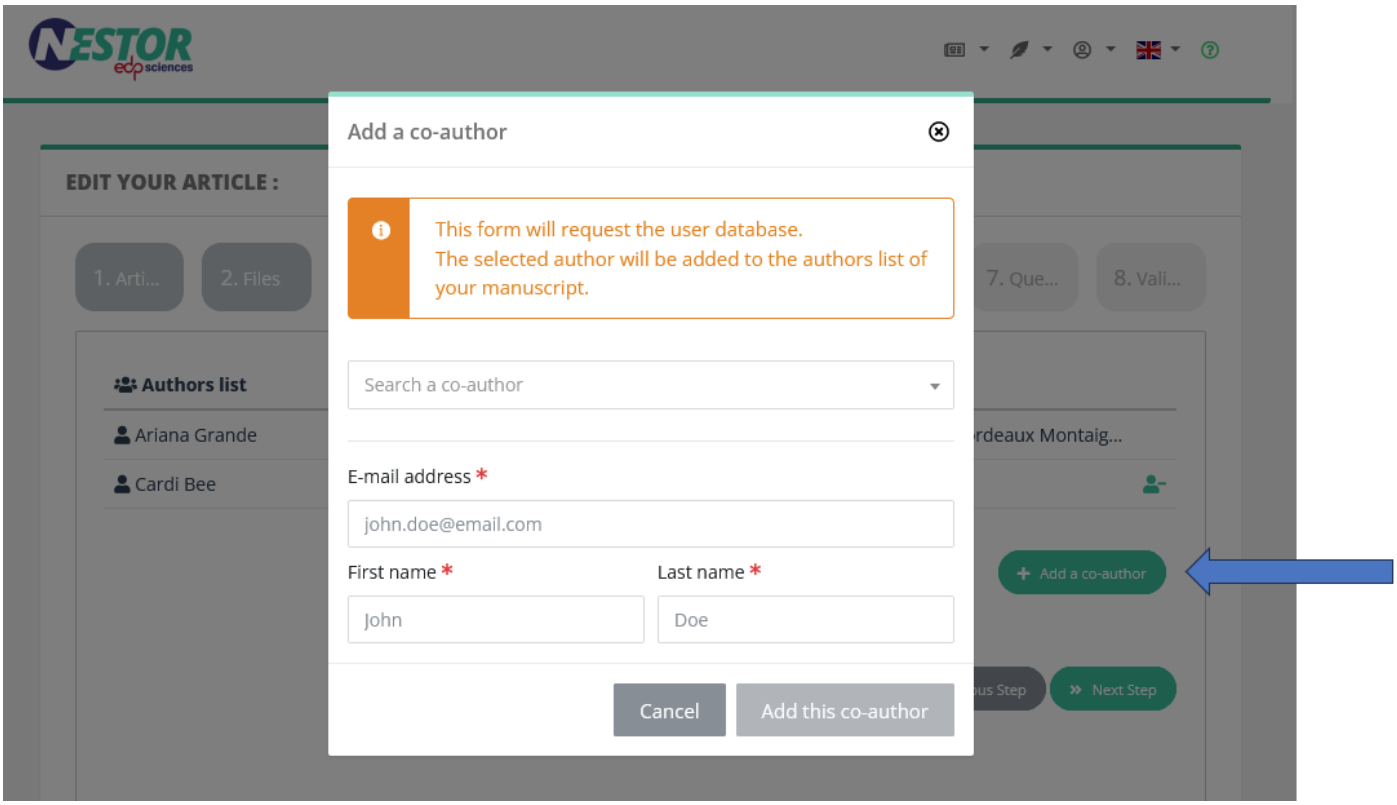

In mail pop-up windows, editors can now enclose files. Size is limited to 10MB, and files are visible in mail history.

Adding co-authors at submission

For the corresponding author, the different functions to add co-authors have been streamlined in one convenient button:

LaTeX compilation: fixes on compressed files

We benefited from a lot of feedback from authors submitting compressed files. We consequently improved our decompression methods, which accordingly fixed several compilation errors.

This change is visible only if you require LaTeX compilation at submission.
